Introduction:

Medical Dispensing Device with “LIVE” Tracking & Monitoring Features

Smart SHABDH™ is a medicine dispenser for patient's / aged people, to consume their weekly / bi-monthly medication, with smart features incorporated for LIVE tracking / monitoring by their health care centers / family members.

Key Features of smart SHABDH™?

- Enables medication tracking / monitoring of patient's / aged people by their health care centers and family members respectively
- Reminding patients with medication schedules
- Alerting patient's for low battery status and re-charging
- Alerting patients with open / close status of the medicine dispenser to avoid exposure to atmosphere

Why LIVE tracking / monitoring?

Certain critical patient's are required to be tracked / monitored for their regular (day to day) consumption of medicine provided by their medical centers to make sure their patient's do not miss out their medication schedules. This will enable the medical centers to monitor and manage their patient's from getting in to serious health conditions due to possible irregular medication schedules. Currently medical centers face a challenge for managing their patient's medication practices. It becomes quite expensive / stressful for both centers and patient's in case of daily visits to the centers. Also, certain patient's are not allowed to access bulk medication for reasons beyond medical centers control.

How does smart SHABDH™ work?

Smart SHABDH™ will send an alert signal to the designated Healthcare centers or authorized call centers, whenever a patient activates the medicine dispenser, to consume his / her medication (as prescribed). The health care centers / call centers will be able to manage all their patient's incoming alert data and track / monitor their patient's. The centers will be able to call back and remind their patients for medication, in case there is no patient alert status received by their database system. Devices with other options available are, with a medication reminder and an automated (hands - free) medication dispensing. All options are enabled with alerts to the respective centers when medication is dispensed.

Smart SHABDH™ requires NO internet / wifi services.
Works on a mobile net service and any mobile phone with minimum 2G service.

Smart SHABDH™ (features)

- Available in various colours and shapes
- Available in (1) manual (2) medication reminder (3) fully automatic dispensing devices
- Wireless is an option, open to consumer with nominal added cost
- LFP battery with long life
- Re-charge alert / music
- Compatible mobile phone chargers for charging
- Mechanical / optical detector
- Portable, compact in size, light weight plastic body
- Custom code alerts, tailor made for disease type for easy identification
- Linked to designated clinical / call center mobile phones
